Jazzalyn & Tim Wedding Experience: Product Doc

Nov 11, 2026 · @Briana

Overview

The demo is a working, mobile-first wedding site for Jazzalyn & Tim. It reworks The Mahogany Pages' city guide so that it is organized by wedding phase. Open the demo.

It was built from screenshots of staging.softqueerwealth.com, not its code. The TMP codebase stays private, and an engineer can port these patterns into it. It is one self-contained HTML file with no build step. Content lives in a data block at the top of the script, and layout is kept separate.

Area	What's real	What's sample or placeholder
Couple & story	Names, Los Angeles as the destination	Photos, love story text, wedding date
Phases	The five phases and their order	NYC and New Orleans dates and venues (illustrative destinations)
LA events	Event types (welcome, ceremony, reception, brunch)	All LA dates, times and venues show "to be announced"; two prep events use labeled sample dates
Places	Category and neighborhood structure	Every listing is a labeled placeholder until TMP research is entered
Wedding party	Roles and the strengths list	All seven people are sample profiles
Tasks	The task model and statuses	All 19 tasks are sample data

Every sample item has a **Sample** tag in the demo. No confirmed bookings, partnerships or discounts are shown.

Demo walkthrough for Jazzalyn

Allow about 10 minutes. Start with how the site feels, then show how it works. Present on a phone: most guests will see it there. Tap **Reset demo** in the top bar before you start.

1. **Home: “this is yours.”** Open the hero. Point out her name and Tim’s, Los Angeles, and “Date to be announced.” Explain that the photo frames are placeholders for their approved photos.
2. **Our Love Story.** Scroll through the chapters: how we met, our journey, the proposal, favorite memories and a message to guests. Tap **Edit our story**, type a line and save it. This shows she can write it herself.
3. **The Journey cards.** Five chapters across three cities. Make the key point here: *the wedding isn’t one day, it’s a collection of celebrations.*
4. **Our Wedding (the guest view).** Date, times, venues, dress code, transport and RSVP each have a clear slot. Unconfirmed details say “To be announced” instead of being guessed.
5. **Explore → Bachelorette.** Choose the celebration and show the four-day New Orleans itinerary grouped by day. It works like the city list on TMP today.
6. **Filters: Bachelorette + June.** Open Filters, pick the phase and the month, and the button shows the result count live. Then show **Reset filters**.
7. **Know Before You Go.** Tap it on the Welcome Dinner to show attire, cost and the reservation. Then open the KBYG tab for the New Orleans city guide and the interactive Before You Go checklist.
8. **Add + My Plan.** Add two events, open **My Plan** and tap **Copy my plan for the group chat**.
9. **LA Places.** Choose Wedding Weekend → Places, then filter by Stay. Show neighborhood, price, distance to the venues and the group-block field.
10. **Timeline → Calendar.** Show February and June. Point out that “Dates to be announced” collects everything that isn’t set yet.
11. **Meet the Wedding Party.** Editorial profile cards with strengths. She decides what’s public.
12. **Dashboard: the practical value.** Show the Demo Mode banner first, then the overview: outstanding and overdue counts, needs attention, responsibilities by person. Switch **Viewing as** to Simone to show what a bridesmaid sees. Change a task to Completed.

13. **Add a task with a suggestion.** Tap + Add task and pick “Budget management.” The site suggests Kendra and shows how many open tasks she has.
14. **Privacy.** Turn Demo Mode off from the menu. The dashboard link disappears and the page asks for sign-in.

Close by asking her for three things: approved photos, their story in their own words, and the real wedding-party list with roles.

Product architecture

Wedding phase becomes the main way to browse, and the city becomes an attribute of each phase. Everything else follows TMP’s existing patterns, so an engineer can reuse TMP’s components instead of rebuilding them.

Main user journeys

User	Journey	Where in the demo
Guest	Read the story → find date, venue, dress code, RSVP	Home → Our Wedding
Guest	Find a hotel and things to do in LA	Explore → Wedding Weekend → Places
Bridesmaid	See the bachelorette itinerary	Explore → Bachelorette → Itinerary
Bridesmaid	See my tasks and deadlines	Dashboard → Viewing as (me)
Bride	See every upcoming milestone	Dashboard → Overview; Timeline
Anyone	Filter by phase + month	Explore → Filters
Anyone	Read Know Before You Go	Any event, or the Explore → KBYG tab
Admin	Add an event or task without an engineer	Dashboard → Add content / + Add task

Navigation

The primary nav has Home, Our Wedding, Explore, Timeline, Wedding Party and Dashboard. The hamburger menu shows the full structure, the Demo Mode switch, and a “Powered by The Mahogany Pages” block styled like TMP's current menu. The Dashboard link only appears for people with permission, which in the demo means Demo Mode is on. Each view has a shareable link (e.g. `#explore-bach`, `#event-la-ceremony`).

Reused TMP patterns (from the staging screenshots)

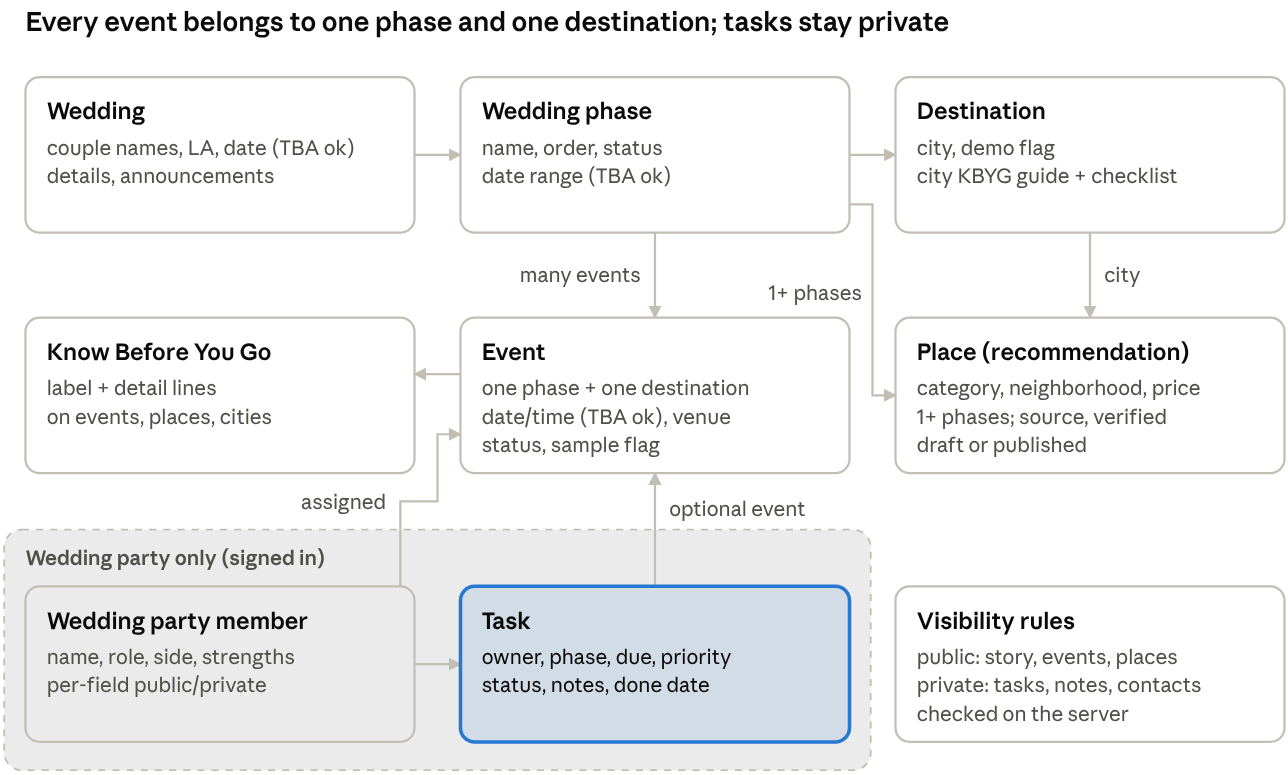

TMP today	In the wedding experience
“Choose your city” dropdown	“Choose your celebration” (phase) dropdown
Green FILTERS button + bottom sheet with chips and “Show N results”	Same sheet, now with phase, month, specific date, date range, place type and neighborhood
Pill tabs (Things to Do / Hangouts / Sexual Wellness / KBYG)	Itinerary / Places / My Plan / Know Before You Go
Day groups (“Wednesday · NOV 11 · 1 event”)	Same day grouping; undated items grouped as “Date TBA”
Event row: tags, title, host, time · price, address link, ADD box, More Info	Same row, plus status tag, Sample tag and assigned people
Accessibility “Click to learn more”	Inline “Know before you go” expander on every event and place
City KBYG cards + dark “Before You Go” checklist	Same cards per destination; the checklist can be ticked
“Pssst…” tip card	Same, explaining phases, filters and Add
Scroll-to-top button, eat/stay sections	Same

New components

- Editorial hero with photo carousel (pause control, respects reduced motion)
- Love story chapters with in-place editing
- Journey cards (one per phase)

- Wedding details grid with “To be announced” states and announcements
- Event detail page: details, KBYG, who’s on it, related places
- Timeline and calendar views with a “Dates to be announced” list
- Wedding party profile cards with per-field visibility
- Private dashboard: stats, needs attention, milestones, workload by person, recently completed, task list with filters and inline status, strengths matrix, task form with skill-based owner suggestions, event form for admins

Data model

data model · 9 entities

Phase names, destinations and people are data, not code, so another wedding can reuse the same components. An event can have several assigned people, a phase holds many events, and a place can belong to more than one phase.

Privacy boundaries

- **Public:** couple story, wedding details, phases, events (title, time, venue, KBYG, assigned names and roles), places, public profile fields.

- **Wedding party only (signed in):** tasks, notes, due dates, workload, contact details, private event details such as a rental's address.
- **Couple and admins only:** editing content, assigning tasks, choosing what each profile shows, inviting members.
- Enforcement must happen on the server: private data is never in public API responses. Hiding a link or obscuring a URL isn't security. In the demo, Demo Mode only switches the view; it is not access control.

Product backlog

The Must Have list is what it takes to launch the real site to guests. The demo already proves out the interface for most of these items; what remains is mostly backend and content.

Must Have

Feature	Acceptance criteria
Port into the TMP codebase on a separate wedding route/subdomain	Runs on staging without changing production or existing TMP data; reuses TMP filter sheet, tabs, event row and KBYG components
Database tables for the data model	Phases, events, places, members, tasks, assignments and KBYG stored server-side; events belong to one phase and one destination; places to 1+ phases; events to 0+ people
Authentication + authorization for the dashboard	Signed-out users get no task/notes/contact data from any API; members see their own tasks plus shared milestones; couple/admins see and edit everything; checked on the server
Real couple content	Approved photos, love story, wedding date and venues entered; all "Sample" tags gone from LA content

Feature	Acceptance criteria
Phase + date filtering	Phase and month filters combine; specific date and range work; undated items appear only when “Date TBA” is chosen; result count is shown before applying; Reset clears everything
Event detail pages	Each event has its own shareable URL with date/time (or TBA), venue, map link, KBYG, assigned people and related places
Know Before You Go	Every event and place shows KBYG; empty fields say “to be announced”; a destination guide exists for each phase
Task tracking that saves	Status changes, notes and new tasks persist and are visible to the right people on any device; completion date is recorded automatically
RSVP	RSVP link or form live; collects attendance, guests, dietary and accessibility needs
Accessibility + mobile	Meets WCAG AA contrast; 44px+ touch targets; full keyboard use; respects reduced motion; loads quickly on 4G

Should Have

Feature	Acceptance criteria
Research import for places	TMP researchers fill a sheet; import creates draft places with source and last-verified date; an editor reviews before they go live
Admin content editor	Couple/admin can add and edit events, places, announcements and profile visibility without an engineer
Profile visibility controls	For each person and field (bio, fun fact, strengths, photo), the couple can choose public or private

Feature	Acceptance criteria
My Plan saved to an account	Guests' saved items follow them across devices once they sign in
Calendar export	"Add to calendar" (.ics) on events with confirmed dates
Notifications	Members get email/text reminders for tasks due in 7 days and when a task is assigned to them
Real share links	Sharing opens the exact event or place, with a preview image for group chats

Future Enhancements

- Make it reusable for other weddings and celebrations (a template per couple), without building full multi-tenancy until there's demand
- Group budget and deposit tracking for trips like the bachelorette
- Photo uploads from guests after each celebration
- Room-block tracking with hotel partners (only once partnerships are approved)
- Group polls (e.g. the New Orleans afternoon outing)
- Seating chart and day-of run of show for the planner

Known limitations

The demo is a working front end with no backend: everything it remembers is stored in one person's browser.

Area	Limitation	What's needed
Placeholder content	Photos, love story, wedding party, NYC/NOLA itineraries, all places and tasks are samples	Real content from Jazzalyn & Tim and TMP research
Missing wedding info	Date, ceremony/reception times and venues, dress code, transport, RSVP are "To be announced"	Couple confirms; entered by admin

Area	Limitation	What's needed
Know Before You Go	City tips are general drafts marked “verify before publishing”; no place has a last-verified date	TMP editorial review before launch
Persistence	Task changes, notes, story edits, My Plan, checklists and added events are saved only in this browser	Database + API
Authentication	None. Demo Mode is a view switch, not access control	Sign-in (e.g. TMP's Cloudflare Access setup, or Clerk/Supabase) + server-side checks
Sharing	“Share” copies a link to the page; there's no preview card for group chats	Real URLs per event/place + preview images
Integrations	No RSVP tool, maps embed, calendar export, booking links or notifications	Pick vendors and connect them
TMP code reuse	Built from screenshots, not TMP's code; patterns match visually but components are re-implemented	Engineer ports into the TMP codebase
Fonts	Loaded from Google Fonts; if they're blocked, the page falls back to system fonts	Self-host fonts in production

UX validation

All seven demo scenarios were run in a phone-sized browser (390px wide) and on desktop; each one works end to end with no script errors. The biggest remaining friction is missing real content, not the interface.

User	Core question	Verdict	Friction found	Proposed fix
Wedding guest	When and where, where to stay, what do I do?	Partly: structure is clear, facts are TBA	Guests may land on NYC/NOLA phases that aren't for them	Default Explore to Wedding Weekend for guests; hide demo phases from the public view at launch
Bridesmaid	What's mine, what's due, what's next?	Yes, via Viewing as	Choosing "Viewing as" manually won't exist in production	After sign-in, open straight to "My tasks"; add reminders
Bride & groom	Does it feel like us? Can we see what's happening?	Feel: depends on photos and story. Overview: yes	Placeholder photos make it feel generic	Collect photos and story first; consider a short welcome video
Wedding admin	Can I update things without an engineer?	Partly: events and tasks yes; places, details and profiles no	No editor for wedding details, places or profile visibility	Should Have: admin content editor + research import

Other fixes made during testing: the phase dropdown no longer cuts off long names on phones, the Explore link always starts from "All celebrations," and the event page has proper side margins.
